Etsy Fee & Pricing Worksheet

Know exactly what you keep on every sale --
before you set a single price.

Etsy doesn't have one fee. It has a stack of smaller ones, and they land on every order whether you planned for them or not. This worksheet breaks the stack down, shows the exact math at three price points, and gives you a table to run your own products through.

The Fee Stack, Fee by Fee

1. Listing fee -- \$0.20 per listing, charged when you publish. Each listing lasts 4 months, then renews for another \$0.20 if you keep it live. In the math below it is counted once per sale.
2. Transaction fee -- 6.5% of the total the buyer pays you (item price plus any shipping you charge; digital downloads have no shipping).
3. Payment processing (US) -- 3% of the order total, plus a flat \$0.25 per order. Rates differ outside the US.
4. Offsite Ads fee -- only when a sale is credited to Etsy's Offsite Ads program: an additional 12% or 15% of the order total, depending on your shop's revenue over the last 365 days. You cannot predict which sales it hits, so the worksheet excludes it -- price to be profitable without it.

Fees change. The rates in this worksheet reflect Etsy's published US fee schedule at the time this course was produced. Always verify against Etsy's current fee policy (Seller Handbook: fees and payments) before pricing a new product line.

The 60-Second Formula

For a US digital download with no Offsite Ads fee, the whole stack collapses into one line:

You keep = (Price x 0.905) - \$0.45

The 0.905 is your price after the 6.5% and 3% percentage fees. The \$0.45 is the two flat fees together (\$0.25 processing + \$0.20 listing). It lands within a cent or two of the exact per-fee math -- close enough to price with confidence.

Worked Examples: What You Actually Keep

Price	Listing fee	Transaction 6.5%	Processing 3% + \$0.25	Total fees	You keep
\$7.00	\$0.20	\$0.46	\$0.46	\$1.12	\$5.88 (84%)
\$17.00	\$0.20	\$1.11	\$0.76	\$2.07	\$14.93 (88%)
\$37.00	\$0.20	\$2.41	\$1.36	\$3.97	\$33.03 (89%)

Read the last column carefully. The flat \$0.45 punishes cheap products: at \$7 you give up 16% of the price, at \$37 only about 11%. Practical rule: price single printables at \$7 or higher, and let anything cheaper live inside a bundle instead.

Your Turn: Run Your Own Products

Fill in one row per product. Work left to right: take 6.5% of your price, take 3% and add \$0.25, add the \$0.20 listing fee, then subtract the total from your price.

Product	Your price	- 6.5%	- 3% and \$0.25	- \$0.20	You keep

Bundle Pricing: Where the Margin Lives

Bundles fix the fee problem and the conversion problem at the same time. The flat \$0.45 in fees is charged once per order, not once per item -- so three \$7 items sold separately lose fees three times, while a \$17 bundle loses them once.

Price the bundle 20-30% below the sum of the singles. Buyers see a clear win, and your keep percentage still climbs because the order total is higher.

Show the anchor: display the combined single prices next to the bundle price ("a \$51 value") so the discount is visible at a glance.

Give every bundle at least one component that is not sold separately -- an exclusive bonus page makes the bundle the obvious choice.

Run the bundle price through the worksheet above before publishing. A bundle under \$12 rarely beats selling its parts as singles.

Price from the payout backwards. Decide what you must keep, then solve for the price: $\text{Price} = (\text{Target keep} + \$0.45) / 0.905$. Want to keep \$15? $(15 + 0.45) / 0.905 = \$17.07$ -- so price at \$17 or \$18, never at \$12 and hope.
